INTRODUCTION. Proteins are large macromolecules which consist of hydrogen, carbon and oxygen; proteins are polymeric chains that are built from monomers known as amino acids. Proteins have a major function in a living organism, for example, the replication of DNA, catalysing metabolic reactions (catalyst); stimulus response and also transporting molecules form one place to another.

Proteins (Exam Questions and Answers) | Microbiology

Ans: A protein is a macromolecule com-

posed of one or more polypeptide chains, each with a characteristic sequence of amino acids linked by peptide bonds. The cells of organisms contain thousands of different proteins each with a different function or biological activity. When UT Austin introduced three short answer essays to their application in 2017, many students felt panicked. Applications are already writing-intensive, so adding even more required writing was an overwhelming prospect. But when it comes down to it, these questions are intended to help students.
